RAPPORT DE CALCUL – POUTRE GFRP

1. DONNÉES D'ENTRÉE

Charges (ELU)

- Moment ultime M_u = **undefined kN·m**
- Effort tranchant V_u = **undefined kN**

Géométrie de la section

- Largeur b = **undefined mm**
- Hauteur h = **undefined mm**
- Hauteur utile d = **undefined mm**

Propriétés du béton

- Résistance f'_c = **undefined MPa**
- Déformation ultime ϵ_{cu} = **undefined**

Armatures longitudinales GFRP

- Diamètre $\varnothing$ = **undefined mm**
- Nombre de barres = **undefined**
- Module E_f = **undefined MPa**
- Résistance f_{fu} = **undefined MPa**

Armatures de cisaillement

- Section A_{fv} = **undefined mm²**
- Espacement s = **undefined mm**
- Résistance f_{fv} = **undefined MPa**
- Coefficient ϕ_v = **undefined**

WWW.CBI-TUNISIA.COM

- Angle θ = undefined °

Serviceabilité

- k_b = undefined
- w_{lim} = undefined mm

2. CALCUL EN FLEXION

Déformation :

$$\epsilon_{frp} = \epsilon_{cu} \times (d - c) / c$$

Contrainte :

$$f_{frp} = E_f \times \epsilon_{frp}$$

Limitation :

$$f_{frp} \leq f_{fu}$$

Effort de traction :

$$T = A_{frp} \times \phi_f \times f_{frp}$$

Effort de compression :

$$C = \alpha_1 \times f_c \times b \times \beta_1 \times c$$

Moment résistant :

$$M_n = T \times z$$

Condition :

$$\phi M_n \geq M_u$$

3. MODE DE RUPTURE

Comparaison :

p_{frp} vs p_{frpb}

- $p_{frp} < p_{frpb} \rightarrow$ Rupture en traction
- $p_{frp} > p_{frpb} \rightarrow$ Rupture en compression
- $p_{frp} \approx p_{frpb} \rightarrow$ État équilibré

4. FISSURATION

Moment de fissuration :

M_{cr}

Condition :

$M_u > 1.5 \times M_{cr}$

5. LARGEUR DES FISSURES

Largeur :

w = valeur calculée

Condition :

$w \leq w_{lim}$

6. CISAILLEMENT

- V_c = contribution béton
- V_{frp} = contribution GFRP

Effort total :

$V_n = V_c + V_{frp}$

Condition :

$V_n \geq V_u$

7. CONCLUSION

- Flexion : Conforme / Non conforme
- Fissuration : Conforme / Non conforme
- Cisaillement : Conforme / Non conforme
